

BW Transformation Technical & Functional Specification

Date: 20-05-2026 09:27 Code ID: 003YQI0VHH7R1IPZFB32W09K4 Complexity: LOW Score: 10

Functional Overview

This process transfers sales information from the source (**ZISSD11**) to the target reporting area (**ZD_SD11**). To ensure data accuracy, the system cross-references three internal reference tables: **Z465D25I3N8**, **ZSALES_MAP**, and **ZCUSTOMER**. The primary business action is to automatically identify and assign the correct **Sales Region** for every customer record. By pulling this specific regional data, the transformation ensures your final reports are enriched with precise location details for better analysis.

AI Analysis

1. Why this complexity was assigned

The routine is categorized as **LOW** because it follows a basic "lookup and assign" pattern. It performs simple data enrichment from secondary tables based on source keys without complex loops, calculations, or conditional branching.

2. Key complexity drivers

* **Database Lookups:** The use of `SELECT SINGLE` inside a routine indicates row-by-row processing. While logically simple, this is a performance anti-pattern in BW.

* **External Dependencies:** The logic depends on three distinct custom Z-tables (`Z465D25I3N8`, `ZSALES\_MAP`, `ZCUSTOMER`), meaning these must exist and be populated in the target environment.

* **Implicit Internal Table:** The `READ TABLE ZCUSTOMER` implies that an internal table is being buffered elsewhere in the code (likely in the Global Data area), adding a small layer of state management.

3. Migration difficulty

LOW.

* **HANA Transformation:** In BW/4HANA, these lookups should be converted to **Left Outer Joins** in a HANA Calculation View or handled via the ***"Read Master Data"*** rule type to enable HANA-runtime pushdown.

* **ABAP Managed Database Procedures (AMDP):** If logic remains in a routine, it must be rewritten in SQLScript for optimal performance, as row-level ABAP selects are a bottleneck in modern SAP BW environments.

4. Are there any custom Z tables present?

YES

Z465D25I3N8

Transformation Summary

SOURCE NAME	SOURCE FIELD NAME	SOURCE TYPE	TARGET NAME	TARGET FIELD NAME	TARGET TYPE
ZISSD11	IMODOCCAT	TRCS	ZD_SD11	COST_VAL_S	ADSO

Custom Z Table Overview

Table	Description	Fields
Z465D25I3N8	Activity	BNAME (CHAR), C001 (INT4), C002 (INT4), C003 (INT4), C004 (INT4), C1DE (INT4), C1DI (INT4), C1MP (INT4), CDTCON (INT4), CEX (INT4)
